

STARR / ProMMiS natural-history framework

Plan a natural-history study for SYNGAP1-related disorder.

A natural-history study follows how a condition changes over time in the people who have it. It shows what typically happens and helps prepare the measurements that future treatment trials will need.

The resource

<https://doi.org/10.1002/epi.70374>

Access: Implementation permissions and resources not checked

Overall: Questions still open

2 checks changed with one source hidden; the overall result did not change. This shows dependence on recorded publications, not biological causality. An unchanged overall outcome can still conceal loss of support for an individual check.

What the sources support

No check is supported by the sources in this view.

Open checks

- **Is an existing natural-history framework documented?**

Information missing

Next question: Which protocol components can be shared with our group?

Who could answer: study coordinator

- **Does this paper report use in SYNGAP1?**

Information missing

Next question: Do our proposed participants resemble the studied cohort?

Who could answer: clinical investigator

- **Have permissions, materials and implementation resources been confirmed for our proposed study?**

Information missing

Next question: Can we access the protocol and instrument materials, and what permissions, staff and equipment are required?

Who could answer: study coordinator

- **Has the framework been assessed for our group's age range, travel constraints and study sites?**

Information missing

Next question: Which components need adapting to our cohort and local study capacity?

Who could answer: clinical investigator

- **Has responsiveness to treatment been established by this paper?**

Information missing, not required

Next question: What additional validation is needed before selecting a treatment-trial endpoint?

Who could answer: outcome-measure researcher

Relevant differences and limits

- Studied in STXBP1-RD and SYNGAP1-RD cohorts only. The authors state an aim to generalize the framework to other DEEs; that extension is not demonstrated in this paper.
- Study team documented (CHOP-led consortium). Ownership of protocol materials not established.
- Not yet checked: instrument licensing; protocol document access; fit for other diseases or age ranges; site capacity.

Proposed next step

Send the open questions below to a study coordinator through one of the public routes listed, and decide together which parts of the resource could inform your study. Nothing here confirms access, permission or suitability.

Public contact routes

- **CURE SYNGAP1** (organization; Fact checked against source)
Patient organization; supports ProMMiS and co-selected its outcome measures; runs a researcher data-request route for a retrospective SYNGAP1 dataset.
<https://curesyngap1.org/contact/>
- **CHOP / Penn ENDD natural history study team** (study team; Source check pending)
Prime site and data coordinating centre for STARR and ProMMiS per the paper; the ENDD page gives a study contact route.
<https://endd.med.upenn.edu/research/natural-history-study/>
- **Stanford Medicine Children's Health synaptopathy team** (study team; Source check pending)
Study site for STARR and ProMMiS per the paper and its own page.
<https://www.stanfordchildrens.org/en/services/synaptopathy/research-innovation.html>
- **Ingo Helbig, MD** (researcher; Source check pending)
Corresponding author of the framework paper; named multi-site PI of STARR on the foundation page. A potential collaborator, not the confirmed owner of protocol materials.
<https://www.stxbp1disorders.org/starr>
- **Jillian L. McKee, MD, PhD** (researcher; Source check pending)
Corresponding (first) author of the framework paper. A potential collaborator.
<https://doi.org/10.1002/epi.70374>
Every source for this contact is hidden in this view.

Draft message

Review and edit before sending. RareBridge does not send messages.

Dear study coordinator,

I lead a patient organization for SYNGAP1-related disorder. We are planning a natural-history study and found the STARR / ProMMiS natural-history framework, described in "A prospective natural history study protocol for clinical trial readiness in synaptic disorders" (<https://doi.org/10.1002/epi.70374>).

We would like to understand whether parts of it could inform our own study. Our open questions are:

1. Which protocol components can be shared with our group?

2. Do our proposed participants resemble the studied cohort?
3. Can we access the protocol and instrument materials, and what permissions, staff and equipment are required?
4. Which components need adapting to our cohort and local study capacity?

Could you tell us who the right person is to discuss this, or point us to the relevant materials?

Thank you,
[Your name]
[Your organization]

Sources hidden in this view

This brief reflects the assessment with these sources hidden:

- A prospective natural history study protocol for clinical trial readiness in synaptic disorders (DOI:10.1002/epi.70374)

Built from the recorded assessment and its sources. No AI-generated text.

Live data from the local RareBridge service (dismech_snapshot+curation_overlay).

This demonstration checks one published framework. It does not search all natural-history studies or establish current recruitment.

A rule-based assessment of curated evidence. No biological validation, access permission, treatment recommendation or calibrated probability is implied.

**Prepared with RareBridge from a three-disease demonstration collection. Not medical advice.
Statuses describe what cited sources say, not clinical validation. Prepared 4 October 2026.**
